

# North Central Tennessee - Water Supply Plan Modeling

Brian McCrodden, P.E.  
Casey Caldwell, E.I.T.

December 4, 2009

# Overview

---

- Review of model schematic
- Review of model inputs
  - Demands
  - Operating policies
  - Reservoir setup
- Preliminary model output

# Review of Model Inputs - Demands Used

---

Utility	Average Daily Demand
Gallatin	5.7 mgd
Westmoreland	0.383 mgd (from Gallatin)
Castalian Springs-Bethpage	0.895 mgd (0.0174 from Westmoreland, rest from Gallatin)
White House	10 mgd
Portland	2 mgd
Simson Co., KY	1.6 mgd (summer only, from White House)

- Not using emergency interconnects
  - Gallatin to White House
  - Springfield to White House
  - White House to Portland
  - Westmoreland to Portland

# Old Hickory Lake Setup

---

- Not explicitly modeling Old Hickory
- Set a high inflow to Old Hickory – enough to meet all system demand
- All demands except Portland are met from Old Hickory

# Portland Operations Summary

---

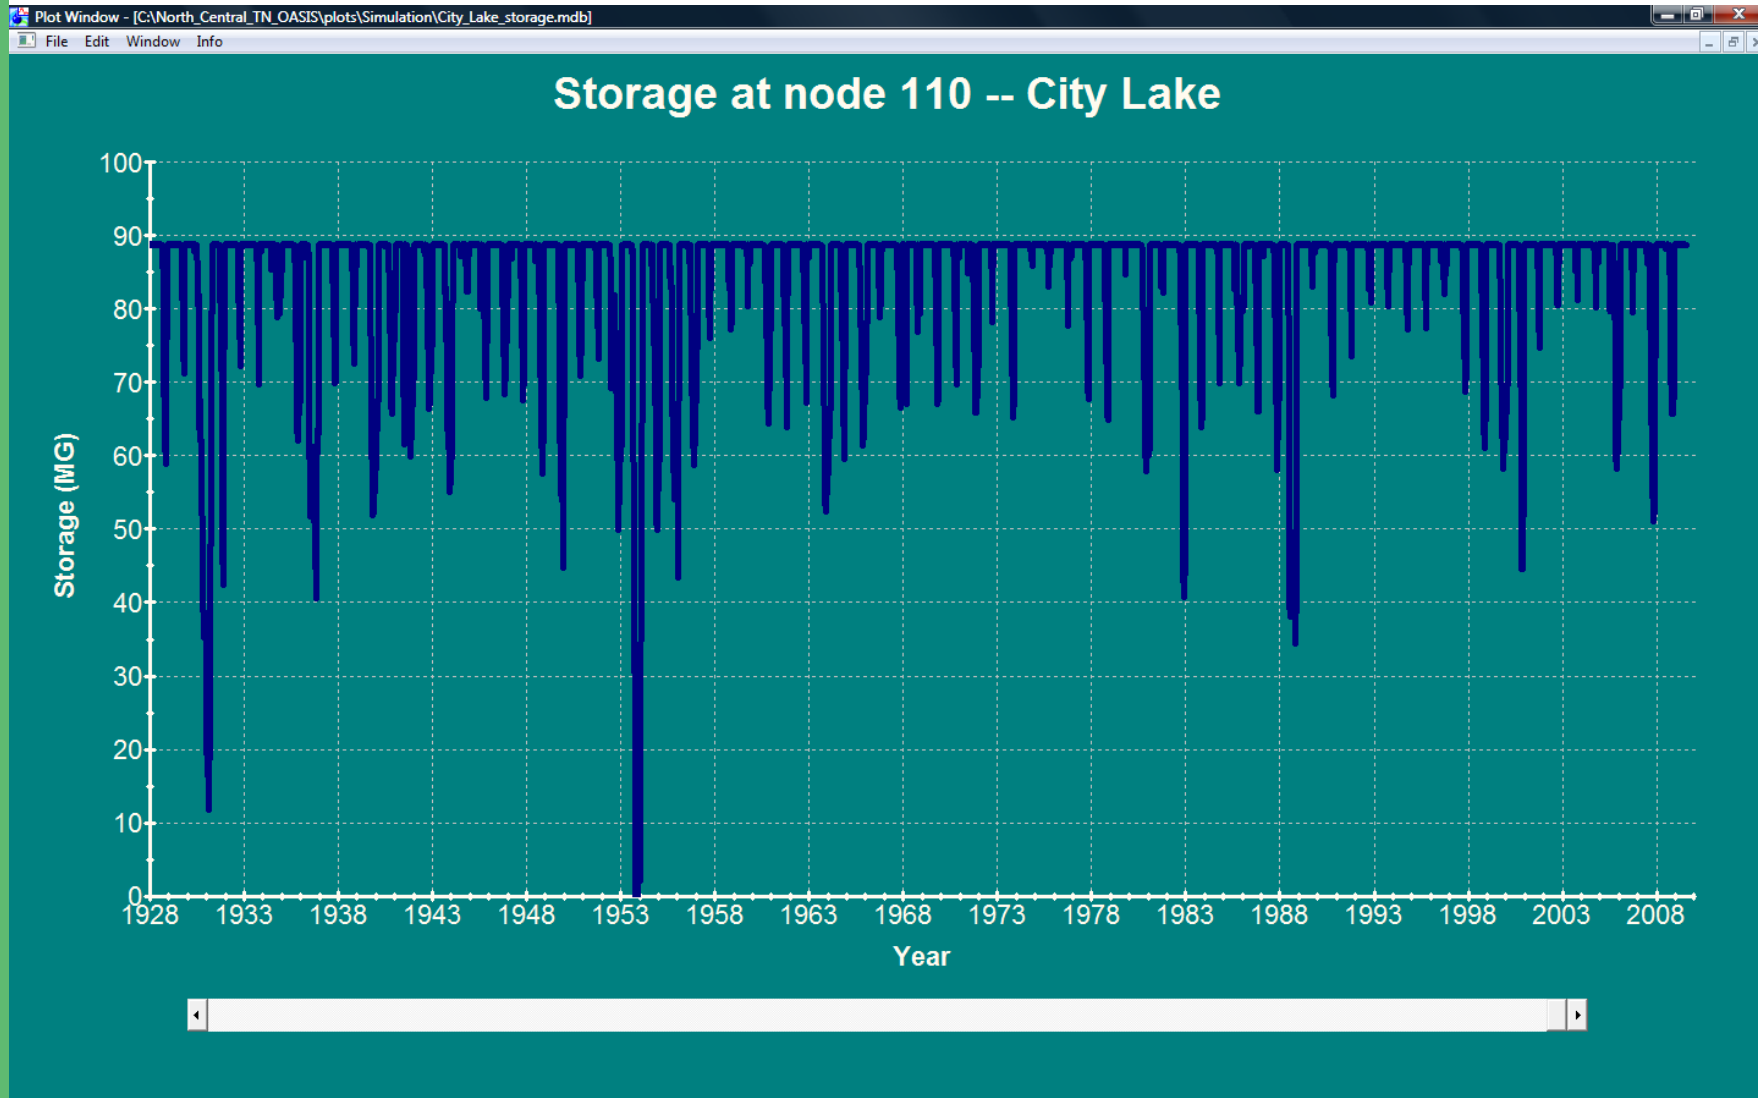

- By default pump from West Fork Drakes Creek
- Pump from City Lake if:
  - Not enough flow in creek to meet demand (pump the deficit amount)
  - Sept. – Oct. (pump 0.5 mgd)

# City Lake Setup

---

- Top / Normal pool elevation 681.6 ft
- Volume at normal pool = 88.6 MG
- Area at normal pool = 24 acres
- Assume all storage is usable
- Bottom elevation 651.6 ft

# Simulated City Lake Storage for Period of Record

# Simulated City Lake Storage for 2007 Drought

# Simulated West Fork Drakes Creek Flows (d/s of intake) for Period of Record

# Simulated West Fork Drakes Creek Flows (d/s of intake) for 2007 Drought – focus on flows < 10 cfs

# Sorted Simulated West Fork Drakes Creek Flows (d/s of intake) for Period of Record
